

Preventing Cyber Attacks Has Never Been Easier

OPAQ Endpoint Protect

When is cyber security insurance not enough? For many small/medium-sized businesses, implementing and managing cyber security controls is overwhelming. Buying, deploying, configuring, monitoring and managing even a handful of security hardware and software tools is complex and expensive. OPAQ Endpoint Protect solves these challenges. Reduce your company's risk and move from a collection of point products to a confident risk management posture. OPAQ's cloud-based "firewall anywhere" protection is affordable, flexible, and simple to manage – it's the easy button for cyber risk management.

Always-On Network Security Follows Users Wherever They Go – From the Cloud

The Easy Button for Enterprise-Grade Cyber Risk Management

Today's workplace is no longer confined by walls. Your users are connecting to your network remotely – from the home, airport, hotel, coffee shop, and many other places. Anti-virus/malware protection alone is only partially effective, and firewalls are not properly located in order to provide protection for remote users who are directly accessing cloud applications and sensitive corporate data.

OPAQ Endpoint Protect prevents attacks and reduces risk by providing intelligence-led protection that secures all network traffic all of the time using Palo Alto Networks Next-Generation Firewalls deployed in the OPAQ Cloud. Always-on protection secures users and devices by ensuring devices are always connected to clean pipes with strong security controls. All network traffic – not just web traffic – to and from the user device traverses OPAQ's highly performant and reliable network. This easy button for enterprise-grade security is enabled with a simple agent download and is centrally managed through a single cloud console. Features include:

- Network intrusion prevention and detection (IPS/IDS)
- Network anti-virus/malware/spyware
- External IP inspection and filtering
- URL inspection and filtering
- Zero-Day protection
- Direct peering with all major cloud providers (AWS, Azure, Google, etc.)
- Direct peering with more than 180 content and Internet service providers
- Upstream transit capacity in excess of 15Gbps

Why OPAQ Endpoint Protect?

- **Advanced** – powerful, always-on Next-Generation Firewall capabilities using Palo Alto Networks NGFW in the OPAQ Cloud prevents cyber attacks and reduces risk
- **Affordable** – predictable per-user monthly rate; no need to invest in expensive, complex security infrastructure
- **Simple** – zero configuration; a quick 5-minute download of the OPAQ Endpoint Protect agent enables you to centrally manage users and devices from the OPAQ cloud console

OPAQ Endpoint Protect is just one of OPAQ's security-as-a-service solutions. It is powering the "Protect Your Assets" service that is offered by PSA Financial as part of its cyber risk management program.
